Estimating Production Functions Of Multiproduct

I estimate production functions of multiproduct firms when technologies are product-specific but inputs are observable only at the firm-level. I provide an estimation strategy that solves for the unobservable inputs while correcting for the well-known simultaneity, collinearity and omitted price problems in production function estimation.

Estimating Production Functions of Multiproduct Firms

Despite the fact that multiproduct firms constitute a considerable share of firms and account for an even greater share of production, virtually all production function estimates are based on the assumption that firms are single-product producers.

Estimating Production Functions Of Multiproduct Firms

Specifically, I consider the nonparametric estimation of multi-product production functions. Among other advantages, explicit modeling of multiple outputs allows the identification of cross-output elasticities representing the technological trade-off between individual outputs along the firm's production possibilities frontier, which a traditional single-output production function approach is unable to deliver.

Estimating Multi-Product Production Functions and ...

Each product is assumed to be produced by two factors, L and K. For each product we have a production function. $x = f_1(L, K)$ $y = f_2(L, K)$ Each production function may be presented by a set of isoquants with the usual properties. We may now obtain the production-possibility curve of the firm by using the device of the Edgeworth box.

Estimating Production Functions Of Multiproduct Firms

3.1 Motivations. Estimating production and cost functions of producers is the cornerstone of economic analysis.; Estimating the functions includes to separate the contribution of observed inputs and the other factors, which is often referred to as the productivity. "What determines productivity?" (Syverson, 2011)-type research questions naturally follow.

Chapter 3 Production and Cost Function Estimation ...

This article proposes the use of finite mixtures of probability distributions to estimate cost functions. The mixture technique allows for the simultaneous existence and unobservability of multiple technologies of production. Technology switching by firms and conventional technical

change can be studied directly.
