The CTPGF approach has also been successfully applied to the transport theory of various systems by many authors. The traditional method is based upon the derivation of a Boltzmann-like quantum transport equation. A detailed review of this sort of works has been presented in Rammer-Smith (1986). In the present article, we briefly introduce our ...

The theory of band structure is necessary for describing the effects of external excitations on transport parameters and properties of optoelectronics devices . Owing to this lack of studies, we have investigated the bands structure of presented LWIR type II SL InAs (d 1 = 47 Å)/Ga 0.75 In 0.25 Sb(d 2 = 21.5 Å) with d 1 /d 2 = 2.186 along the ...

The nervous system is a non-linear dynamical complex system with many feedback loops. A conventional wisdom is that in the brain the quantum fluctuations are self-averaging and thus functionally negligible. However, this intuition might be misleading in the case of non-linear complex systems. Because of an extreme sensitivity to initial conditions, in complex systems the microscopic ...

QTT is thus concerned with: (1) an explanatory and supportive theory for the Boltzmann picture, where that exists; (2) setting confidence limits for the application of BTT; (3) developing the necessary novel concepts and transport kinetics for genuine quantum transport phenomena (the latter may be loosely defined as those effects which depend ...

The underlying theory of the strong interactions is called Quantum Chromodynamics (QCD) and has quarks (like electrons) and gluons (like photons except they are self-interacting) as its fundamental constituents. These quarks and gluons are bound so strongly that they can never appear as free particles. This is called confinement.
